

The MSCI logo consists of the letters "MSCI" in a white, serif font, centered within a dark blue rectangular box. This box is the leftmost part of a horizontal graphic element that spans the width of the page. The graphic element is composed of two thin, dark blue lines that curve upwards from the left and downwards from the right, meeting at a central point. The area between these two lines is white, creating a lens-like shape that tapers towards the center.

About MSCI..... 10

Section 1: Introduction

MSCI estimates the economic exposure of a company based on the geographic distribution of its revenues. The economic exposure of a company can serve as a complementary or an alternative definition of the country factor that has traditionally been derived from a company's country of domicile and primary listing.

The MSCI Economic Exposure Indices aim to reflect the performance of companies with high economic exposure to specific regions and countries. The MSCI Economic Exposure Indices could be based on exposure to different regions or countries such as:

- Developed markets indices with high exposure to developed markets / emerging markets / specific regions such as Asia Pacific, etc.
- Emerging markets indices with high exposure to developed / emerging markets.
- Domestic exposure indices, for example, MSCI USA constituents with high exposure to USA.

The design of the MSCI Economic Exposure Indices aims to strike a balance between high exposure to the target region and adequate market cap coverage. Index stability, reflected in a stable number of securities, consistent market cap coverage and low index turnover are additional desirable features of the methodology.

This document describes a generic methodology that can be applied to create MSCI Economic Exposure Indices from any existing MSCI Equity Index.

Section 2: Index Construction Methodology

Section 2.1: Applicable Universe:

The applicable universe includes all the existing constituents of an underlying MSCI parent index (herein, a "Parent Index"). This approach aims to provide an opportunity set with sufficient liquidity and capacity. The relevant MSCI Parent Index would be any country or regional equity index.

Section 2.2: Security Selection:

All the existing constituents of the relevant MSCI Parent Index are ranked based on their economic exposure to the target region or country. The details of determining the economic exposure of a company to a target region or country are set forth in Appendix I. MSCI Economic Exposure Indices are constructed with a fixed number of companies approach. A target number of companies are predetermined for every MSCI Economic Exposure Index with an aim to attain a high exposure to the target region or country with reasonable market cap coverage. However, if there are multiple companies with the same rank then the number of companies may deviate from the predetermined target number of companies for the index. The details of the fixed number of companies for different existing MSCI Indices with EM Economic Exposure are provided in Appendix II.

For example, in the case of the MSCI World with EM Exposure Index, all the constituents of the MSCI World are ranked according to their EM exposure. The top 300 companies with the highest economic exposure to emerging markets are selected for inclusion into the MSCI World with EM Exposure Index.

Section 2.3: Weighting Scheme:

For a given rebalancing effective date, all the securities eligible for inclusion in the MSCI Economic Exposure Indices are weighted by the product of their market capitalization and economic exposure. The final security level inclusion factor is determined as the ratio of the security level weight and the security level pro forma market cap weight in the relevant MSCI Parent Index.

Section 2.4: Rebalancing Frequency:

The MSCI Economic Exposure Indices are rebalanced semi-annually. This approach aims to capture timely updates to economic exposures of companies and coincides with the rebalancing frequency of the relevant MSCI Parent Indices. In addition, buffer rules are applied at the time of the semi-annual rebalancing to mitigate turnover of the MSCI Economic Exposure Indices.

Section 2.5: Buffer Rules:

To reduce index turnover and enhance index stability, buffer rules are applied at 20% of the fixed number of companies in the MSCI Economic Exposure Indices. For example, the MSCI World with EM Exposure Index targets 300 companies and the buffers are applied between rank 241 and 360. The companies in the MSCI Parent Index with an economic exposure rank at or above 240 will be added to the MSCI World with EM Exposure Index on a priority basis. The existing Parent Index companies that have an economic exposure rank between 241 and 360 are then successively added till the number of companies in the MSCI World with EM Exposure Index reaches 300. If the number of companies is below 300 after this step, the remaining companies in the Parent Index with the highest economic exposure

rank are added till the number of companies in the MSCI World with EM Exposure Index reaches 300. In the event of multiple companies having a rank of 300, all the companies with an economic exposure rank of 300 are included in the MSCI World with EM Exposure Index.

Section 3: Maintaining MSCI Economic Exposure Indices

Section 3.1: Semi-Annual Index Reviews

The MSCI Economic Exposure Indices are rebalanced on a semi-annual basis, usually as of the close of the last business day of May and November, coinciding with the May and November Semi-Annual Index Review of the MSCI Investable Market Indices. The pro forma MSCI Economic Exposure Indices are in general announced nine business days before the effective date.

At each rebalancing, a constraint factor is calculated for every constituent in the MSCI Economic Exposure Index. The constraint factor is defined as the weight of a constituent in the MSCI Economic Exposure Index at the time of the rebalancing divided by its weight in the MSCI Parent Index. The constraint factor as well as the constituents in the index remain constant between index reviews except in case of corporate events as described below.

Section 3.2: Ongoing Event Related Changes

In general, the MSCI Economic Exposure Indices follow the event maintenance of the relevant MSCI Parent Indices.

Section 3.2.1: IPOs and other early inclusions

IPOs and other newly listed securities will only be considered for inclusion at the next Semi-Annual Index Review in the MSCI Economic Exposure Indices, even if they qualify for early inclusion in the relevant MSCI Parent Indices.

Section 3.2.2: Additions and Deletions due to corporate events

The general treatment of additions and deletions due to corporate events aims at reducing turnover in the MSCI Economic Exposure Indices.

A constituent deleted from the MSCI Parent Index following a corporate event or during the Quarterly Index Review of the Parent Index will be simultaneously deleted from the MSCI Economic Exposure Indices.

There will be no early inclusion of new securities to the MSCI Economic Exposure Indices, except when a new security results from an event affecting an existing constituent (e.g., mergers and acquisitions, spin offs).

In the event of a merger or an acquisition where an index constituent acquires another index constituent or merges with another index constituent, the remaining company is maintained in the index with its constraint factor before the corporate event.

If a spun off security of an index constituent is added to the Parent Index, it will be reviewed for inclusion in the MSCI Economic Exposure Indices at the next semi-annual rebalancing.

A constituent deleted from the Parent Index following a corporate event or during the Quarterly Index

Review of the Parent Index will be simultaneously deleted from the MSCI Economic Exposure Indices.
Please refer to Appendix III for more details on the treatment of corporate events.

Appendix I: Determination of Company Level Economic Exposure

Estimating Economic Exposure of Companies

The economic exposure of a company to a target region or country is the proportion of its revenues coming from that region. As a general principle, MSCI estimates economic exposure from the geographic segment distribution of revenues by final markets/destination as reported by a company and the GDP weight of the countries and regions within a specific geographic segment.

For example, in the case of determining EM exposure, all countries and regions (including frontier markets) except developed markets are included for the calculation of the EM exposure of a company. The emerging markets multiplier (EM Multiplier) of a reporting geographic segment is the GDP weight of the emerging market countries within that segment. The EM exposure of a security is derived as the weighted average of the percentage segment revenue and the EM Multiplier.

The GDP data used is the most recent nominal GDP data of countries as reported by IMF and World Bank.

Exhibit 1: Example Calculation of EM Exposure for ABC Ltd.

Segment	Revenue (\$ mil)	Revenue (%)	EM Multiplier	EMX contribution
France	2,000	12%	0.00	0.00
Rest of Europe	3,000	18%	0.20	0.04
United States	5,000	30%	0.00	0.00
Japan	4,000	24%	0.00	0.00
Rest of Asia	1,500	9%	0.95	0.09
Rest of the World	1,000	6%	0.67	0.04
Total	16500	100%		0.16

1.1. Revenues by final markets/destination

As a general principle, when a company reports revenue distributions by subsidiary locations and by final markets/destination, the revenue distribution by final markets/destination is used.

For re-insurance firms, the geographic segment data may be reported by subsidiary locations or by ceding company locations. The subsidiary location is the location of the reinsurance company subsidiary that is generating the revenue, while the ceding company is the insurance company that passes a part or all of its risks from its insurance portfolio to the reinsurance firm. The geographic segment distribution of revenues by ceding company locations is used wherever possible for estimating economic exposure.

In the case of companies that report revenues only by source of production or operations (e.g., mining locations or Assets) and there is no reported information on revenues by end markets or customer segments, the geographic segment revenues reported by source of production or operations may be used to estimate the company's economic exposure. In cases where companies report geographic segment revenues by production source and based on sales from end markets (by volume), the distribution of sales by volume is used to estimate economic exposure.

1.2. Geographic segments reported across multiple business lines

If a company reports its geographic segments for each of its business lines, the economic exposure is estimated at each business segment and then aggregated at the company level using the business segment revenue weights. For example, a company may present the following geographic segment revenue information:

Segment	Revenue	Revenue (%)
General Insurance		
Asia	90	90%
Rest of the World	10	10%
Total	100	100%
Life Insurance		
Asia	80	40%
Europe	60	30%
Rest of the World	60	30%
Total	200	100%
Total consolidated	300	

In this case, the aggregate exposure of the company is a weighted average of individual business segment exposures (with the weights being the individual business segment revenues). In cases where the geographic segment information is only available for some of the business segments, the exposure of the business segments where geographic segment information is unavailable is assumed to be in the same proportion as the business segments for which the information is available.

1.3. Geographic segment Revenues reported as either “Predominantly” or “more than x%”

1.3.1 If the geographic segments are reported as “predominantly/substantially from Japan”, all of the firm’s revenues are assigned to Japan.

1.3.2 If the geographic segments are reported as “more than x% coming from Japan” then

- If $x \geq 90\%$, all of the firm’s revenues are assigned to Japan
- If $x < 90\%$, Japan is assigned $x\%$ of the firm’s revenues and Rest of the World is assigned $(100-x)\%$

1.4. Revenues for Banks and Insurance companies

The revenues for Financial companies are determined as the sum of Net Interest Income (NII) + Commissions and Fees + Realized Gains on Sales of Investments – Impairment Losses Recognized for Earnings + Insurance Premiums + Other Revenues.

Insurance companies’ total income is defined as the sum of net premiums + fees + investment income + commissions + other income.

If such data is not available, then the geographic segment revenue distribution as reported by the company is considered for estimating economic exposure.

1.5. Other relevant metrics where the geographic distribution of revenues is not reported

For companies that do not report geographic distribution of revenues, other metrics such as the geographic distribution of dividends from investment portfolios (for holding companies), credit exposures (for banks), assets and other relevant metrics (number of restaurants or sales by volume) as reported by the company may be used to estimate economic exposure.

Appendix II: Target Number of Companies in MSCI Indices with EM Exposure

<i>Index</i>	<i>Target Region</i>	<i>Number of companies</i>
MSCI World with EM Exposure	EM	300
MSCI Europe with EM Exposure	EM	100
MSCI USA with EM Exposure	EM	100
MSCI EAFE with EM Exposure	EM	200
MSCI World ex Israel with EM Exposure ¹	EM	-

Appendix III: Corporate Events Treatment

This appendix describes the treatment of the most common corporate events in the MSCI Economic Exposure Indices. Details regarding the treatment of all other corporate events not covered in this appendix can be found in the MSCI Corporate Events Methodology book, available at

http://www.msci.com/products/indices/country_and_regional/dm/methodology.html

Event Type	Event details	Action
Acquisition	MSCI Economic Exposure Index constituent acquires another MSCI Economic Exposure Index constituent	Maintain acquiring company with the acquiring company's constraint factor and remove acquired company
	MSCI Economic Exposure Index	Maintain acquiring company

¹ MSCI World ex Israel with EM Exposure Index is constructed by excluding companies from Israel from the MSCI World with EM Exposure Index

Event Type	Event details	Action
	constituent acquires non MSCI Economic Exposure Index constituent	with the acquiring company's constraint factor
	Non MSCI Economic Exposure Index constituent acquires MSCI Economic Exposure Index constituent	Remove acquired company without adding acquiring company
Merger	MSCI Economic Exposure Index constituent merges with MSCI Economic Exposure Index constituent	Add new company with the constraint factor of the existing MSCI Economic Exposure Index constituent to which the new company is linked
	MSCI Economic Exposure Index constituent merges with non MSCI Economic Exposure Index constituent	Add new company if MSCI links the new company to the existing MSCI Economic Exposure Index constituent, with the constraint factor of the existing MSCI Economic Exposure Index constituent. New company not added if it is linked to the non MSCI Economic Exposure Index constituent
IPO	IPO added to MSCI Parent Index	IPO reviewed for inclusion into the MSCI Economic Exposure Index at the next Semi-Annual Index Review.
Spin-off	MSCI Economic Exposure Index constituent spins off a security	Spun-off security is not added to the MSCI Economic Exposure Indices and reviewed for inclusion in the MSCI Economic Exposure Index at the next semi-annual index review
Conversion	Security A converted to B, A deleted from Parent Index, B added	B is not added to the MSCI Economic Exposure Indices
Country Reclassification	Domicile of company reviewed: Security A deleted from country A, security B added to country B	B is not added to the MSCI Economic Exposure Indices
Stock exchange reclassification	Stock exchange (price source) of company reviewed: Security A deleted, security B added	B is not added to the MSCI Economic Exposure Indices

About MSCI

MSCI Inc. is a leading provider of investment decision support tools to investors globally, including asset managers, banks, hedge funds and pension funds. MSCI products and services include indices, portfolio risk and performance analytics, and governance tools.

The company's flagship product offerings are: the MSCI indices with approximately USD 7 trillion estimated to be benchmarked to them on a worldwide basis¹; Barra multi-asset class factor models, portfolio risk and performance analytics; RiskMetrics multi-asset class market and credit risk analytics; MSCI ESG (environmental, social and governance) Research screening, analysis and ratings; ISS governance research and outsourced proxy voting and reporting services; FEA valuation models and risk management software for the energy and commodities markets; and CFRA forensic accounting risk research, legal/regulatory risk assessment, and due-diligence. MSCI is headquartered in New York, with research and commercial offices around the world.

¹As of June 30, 2011, based on eVestment, Lipper and Bloomberg data.
