

MSCI Nihonkabu Risk Weighted Index (JPY)

The **MSCI Nihonkabu Risk Weighted Index** is based on a traditional market cap weighted parent index, the MSCI Nihonkabu Index, which includes large and mid cap Japan equity universe excluding equity REIT securities. Constructed using a simple, but effective and transparent process, the MSCI Nihonkabu Risk Weighted Index reweights each security of the parent index so that stocks with lower risk are given higher index weights. Historically the index has exhibited lower realized volatility in comparison to its parent index, while maintaining reasonable liquidity and capacity. The MSCI Nihonkabu Index is a domestic index, and uses the Domestic Inclusion Factor (DIF) to calculate the free float of securities available for purchase in the Japan public equity markets by domestic Japanese investors.

SECTOR WEIGHTS

MSCI FACTOR BOX AND FaCS FRAMEWORK (Please refer to complete description of the MSCI FaCS methodology [here](#))

MSCI FaCS is a standard method for evaluating and reporting the Factor characteristics of equity portfolios. MSCI FaCS consists of Factor Groups (e.g. Value, Size, Momentum, Quality, Yield, and Volatility) that have been extensively documented in academic literature and validated by MSCI Research as key drivers of risk and return in equity portfolios. These Factor Groups are constructed by aggregating 16 factors (e.g. Book-to-Price, Earnings/Dividend Yields, LT Reversal, Leverage, Earnings Variability/Quality, Beta) from the latest Barra global equity factor risk model, GEMLT, designed to make fund comparisons transparent and intuitive for use. The MSCI Factor Box, which is powered by MSCI FaCS, provides a visualization designed to easily compare absolute exposures of funds/indexes and their benchmarks along 6 Factor Groups that have historically demonstrated excess market returns over the long run.
