   About MSCI .......................................................... 16
1. Introduction

Fundamental factors have become increasingly important in various areas of the investment process, including risk management and portfolio construction. Fundamental factors represent sources of systematic risk and return.

MSCI has done extensive research to identify the common factors driving equity markets and built factor models to capture these common sources of risk and return. MSCI research shows that three types of fundamental factors account for a significant part of the commonality in equity returns across different markets and time periods: country factors, industry factors, and style factors. The main style factors include size, value, momentum, volatility and growth, to name a few.

The MSCI Market Neutral Barra Factor Indices aim to capture systematic returns associated with a particular style factor while maintaining minimum exposure to other factors such as industry, country or other style factors. These indices are constructed by optimizing a parent MSCI index to achieve a specified high level of exposure to a particular Barra style factor (herein, “Target Factor”), very low exposure to all other style, industry and country factors, and low tracking error to a corresponding Pure Factor portfolio\(^1\) (herein, “Benchmark”). MSCI currently offers Market Neutral Barra Factor Indices that target the Momentum & Volatility style factors.

This methodology book describes the generic methodology to create MSCI Market Neutral Barra Factor Indices based on an existing MSCI Equity Index (a “Parent Index”) using the Barra Optimizer and the applicable Barra Equity Model. Further information about the Barra Optimizer and the various Barra Equity Models can be found at [www.msci.com/products](http://www.msci.com/products).

2. Main Characteristics of MSCI Market Neutral Barra Factor Indices

The MSCI Market Neutral Barra Factor Indices aim to track the performance of stocks within a parent index with a high exposure to the Target Factor and low exposure to the non-target factors. The MSCI Market Neutral Barra Factor Indices aim to minimize tracking error relative to the Benchmark with controlled index turnover. The MSCI Market Neutral Barra Factor Indices are rebalanced at a monthly frequency.

---

\(^1\) Pure Factor portfolios are the portfolios that have unit exposure to a Target Factor and no exposure to country, industry and non-target style factors.
3. Constructing the MSCI Market Neutral Barra Factor Indices

The MSCI Market Neutral Barra Factor Indices are constructed by optimizing a Parent Index in conjunction with a Barra Equity Model to achieve a specified stable level of exposure to the Target Factor and a controlled level of exposure to all other style, industry and country factors, while minimizing the tracking error relative to the Benchmark, for a given set of investability constraints. Constructing the MSCI Market Neutral Barra Factor Indices involves the following steps:

- Specifying the Parent Index, Benchmark and the Barra Equity Model for optimization
- Specifying the Target Factor and optimization objective
- Specifying the optimization constraints
- Calculating the optimized index

The steps for constructing the MSCI Market Neutral Barra Factor Indices are described below.

3.1. Specifying the Parent Index, Benchmark and the Barra Equity Model for optimization

Constructing the MSCI Market Neutral Barra Factor Indices begins with the selection of the Parent Index, the Benchmark and the relevant Barra Equity Model for the optimization. For the MSCI Market Neutral Barra Factor Indices:

- the Parent Index is the applicable MSCI Standard Index and serves as the eligible universe of securities for the optimization process
- the Benchmark for the optimization is the applicable Pure Factor portfolio
- the applicable Barra Equity Model is the relevant global, regional or single country Barra Equity Model.

For example, to construct the MSCI Europe Market Neutral Barra Factor Indices, the MSCI Europe Index is the applicable Parent Index. The Barra Europe Short-Term Model (EUE3SBAS) would be used as the underlying risk model for the optimization. The Pure Factor portfolio corresponding to the Target Factor and the applicable Barra Equity Model (in this case, EUE3SBAS) would be used as the Benchmark for the optimization.

The optimization relies on the factor exposures for all the securities in the Parent Index and the factor covariance matrix of the relevant Barra Equity Model. The optimization is performed using a base currency (e.g., the Euro is the base currency for the MSCI Europe Market Neutral Barra Factor Indices).

3.2. Specifying the Target Factor and optimization objectives

The optimization objective is to minimize the tracking error of the MSCI Market Neutral Barra Factor Index relative to the Benchmark, subject to the optimization constraints specified in Section 3.3.
The MSCI Market Neutral Barra Factor Index targets 1 or -1 standard deviation of exposure to the Target Factor. Please refer to Appendix I for the current list of MSCI Market Neutral Barra Factor Indices and their intended Target Factor exposure.

### 3.3. Specifying the optimization constraints

At each monthly index rebalancing, specific optimization constraints are applied with an aim to control the level of exposures to non-target factors, and to achieve a balance between the objectives of replicability and investability, high exposure to the Target Factor, low tracking error to the Benchmark and low index turnover relative to a Barra Pure Factor portfolio.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>MSCI Market Neutral Barra Factor Index</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent Index (Stock Selection Universe)</td>
<td>MSCI Europe</td>
</tr>
<tr>
<td>Benchmark/ Reference portfolio</td>
<td>Barra Pure Factor portfolio</td>
</tr>
<tr>
<td>Barra Model</td>
<td>EUE3SBAS</td>
</tr>
<tr>
<td>Index Type</td>
<td>Market Neutral Barra Factor</td>
</tr>
<tr>
<td>Optimization Objective</td>
<td>Minimizing active risk relative to Benchmark</td>
</tr>
<tr>
<td>Gross Leverage</td>
<td>2 (100% Long and 100% Short)</td>
</tr>
<tr>

<td>1 or -1 standard deviation</td>
</tr>
<tr>
<td>Non-target style factor exposure</td>
<td>+/- 0.1</td>
</tr>
<tr>
<td>Industry factor exposure</td>
<td>+/- 3%</td>
</tr>
<tr>
<td>Country factor exposure</td>
<td>+/- 3%</td>
</tr>
<tr>
<td>Max number of stocks</td>
<td>300</td>
</tr>
<tr>
<td>Maximum constituent weight</td>
<td>+/- 3%</td>
</tr>
<tr>
<td>One-way monthly turnover</td>
<td>10% (i.e. 5% on Long &amp; Short portfolio each)</td>
</tr>
<tr>
<td>1-month ADV Trade Limit(^2)</td>
<td>10%</td>
</tr>
<tr>
<td>Shorting Cost threshold(^3)</td>
<td>100bps (buffer-33bps)</td>
</tr>
</tbody>
</table>

- At each monthly index rebalancing, the weight of each index constituent will not change more than a predefined Trade Limit linked to the stock’s Average Daily Traded Value.

\(^2\) Please refer to Appendix IV for the calculation of the Trade Limit

\(^3\) Please refer to Appendix III for the details on Shorting Cost
At each monthly index rebalancing, the weight of an index constituent will not be more than +/- 3% in absolute terms. When this constraint is in conflict with the Trade Limit constraint defined above, the Trade Limit constraint takes precedence.

3.4 Calculating the MSCI Market Neutral Barra Factor index

The approach for calculating the daily index levels of an MSCI Market Neutral Barra Factor Index is as follows:

- The MSCI Market Neutral Barra Factor Index is a combined index of two sub-indices.
- The two sub-indices are,
  - Long Index – Index of Long constituents from optimized portfolio
  - Short Index – Index of Short constituents from optimized portfolio
- The daily returns of the MSCI Market Neutral Barra Factor Index are computed as follows:

\[
Index_T = (1 + W_{L,T} \times R_{L,T} - W_{S,T} \times R_{S,T}) \times Index_{T-1}
\]

Where,

- \( W_{L,T} \) = Long Index weight for \( T \)
- \( W_{S,T} \) = Short Index weight for \( T \)
- \( R_{L,T} \) = Daily return on Long Index from \( T-1 \) to \( T \)
- \( R_{S,T} \) = Daily return on Short Index from \( T-1 \) to \( T \)

The sub-index weights will be determined as follows:

\[
W_{L,T} = W_{L,T-1} \times \frac{(1+R_{L,T-1})}{(1+R_{P,T-1})}
\]

\[
W_{S,T} = W_{S,T-1} \times \frac{(1+R_{S,T-1})}{(1+R_{P,T-1})}
\]

- \( R_{L,T-1} \) = Daily return on Long Index from \( T-2 \) to \( T-1 \)
- \( R_{S,T-1} \) = Daily return on Short Index from \( T-2 \) to \( T-1 \)
- \( R_{P,T-1} \) = Daily return on MSCI Market Neutral Barra Factor Index from \( T-2 \) to \( T-1 \)

At the effective date of each monthly rebalancing, the Long Index weight and Short Index weight will be reset to 100% & -100% respectively.
4. Maintaining the MSCI Market Neutral Barra Factor Indices

4.1. Monthly index reviews

The index review of the MSCI Market Neutral Barra Factor Indices is scheduled for the beginning of each month following the release by Barra to its clients of the monthly updates of the security exposure data and factor variances and co-variances data of the relevant Barra Equity Model. The rebalancing date for the MSCI Market Neutral Barra Factor Indices is as specified in Appendix II (the “Rebalancing Date”). The Rebalancing Date of the MSCI Market Neutral Barra Factor Indices may vary depending on the release date of the monthly update of the corresponding Barra Equity Model. The release date of the monthly update of the relevant Barra Equity Model will be announced to all MSCI Market Neutral Barra Factor Index clients on or before the release.

The rebalancing of the MSCI Market Neutral Barra Factor Indices is conducted as of the close of the Rebalancing Date. The changes resulting from the index rebalancing will be announced on the Rebalancing Date and will be effective from the third business day following the Rebalancing Date.

Please refer to Appendix II for further information about the monthly rebalancing timeline.

4.2. Ongoing event related changes

IPOs and other newly listed securities will only be considered for inclusion at the next rebalancing, even if they qualify for early inclusion in the MSCI Standard Indices.

The general treatment of additions and deletions due to corporate events aims at minimizing turnover in the MSCI Market Neutral Barra Factor Indices.

There will be no early inclusion of new securities to the MSCI Market Neutral Barra Factor Indices, except when the new security results from an event affecting an existing constituent (e.g., spin off, merger). Otherwise, a new addition to the Parent Index outside the regular semi-annual and quarterly index reviews will be considered for addition to the MSCI Market Neutral Barra Factor Indices at the next regularly scheduled monthly index review.

A constituent deleted from the Parent Index following a corporate event or during the Quarterly Index Review of the Parent Index will be simultaneously deleted from the appropriate sub-index (i.e. Long Index or Short Index) of the Market Neutral Barra Factor Index, as applicable. The deleted security’s weight in the respective sub-index will be automatically reallocated to the remaining constituents of that sub-index in proportion to the weights of the remaining constituents in that sub-index before the deletion.

Please refer to Appendix VIII for the details of corporate event treatments.

<td>Volatility</td>
<td>1</td>
</tr>
<tr>
<td>MSCI Europe Market Neutral Barra Volatility Index (USD)</td>
<td>Volatility</td>
<td>1</td>
</tr>
</tbody>
</table>

The above indices will be available with Price, Gross & Net variants
Appendix II: Monthly Rebalancing Timeline

The Rebalancing of the MSCI Market Neutral Barra Factor Indices occurs after the monthly update of the corresponding Barra Equity Model.

The target release date of the Barra European Equity Model is the first calendar day after the last business day of the previous month. The Rebalancing Date for the MSCI Market Neutral Barra Factor Indices is the close of the second business day of the rebalancing month. The changes resulting from the index rebalancing will be announced at the close of Rebalancing Date and will be effective from the fifth business day of the rebalancing month.
Appendix III: Defining Shorting Cost Cutoff

This MSCI Market Neutral Barra Factor Indices are screened using certain short interest data sourced from Data Explorers. See www.dataexplorers.com for further information regarding short interest data.

The Shorting Cost for each security is the Value Weighted Average Fee 7 Day sourced from Data Explorers, which reflects the average cost of borrowing for all trades in the last 7 calendar days. If the Value Weighted Average Fee 7 Day is not available, the Value Weighted Average Fee for a longer period will be used.

For a current constituent, if a security’s Shorting Cost at the monthly index review exceeds a Shorting Cost Cutoff of 133 basis points, the security will be excluded from the MSCI Market Neutral Barra Factor Index. For a new security, the Shorting Cost cut off is 100 basis points. If a security is not covered by the Shorting Cost data sourced from Data Explorers, it will also be excluded from the MSCI Market Neutral Barra Factor Index.

All securities in Greece will be excluded from the MSCI Market Neutral Barra Factor Index, as a result of short selling restrictions in Greece.

The Shorting Cost Cutoff is subject to quarterly reviews.
Appendix IV: Defining Trade Limits

In the monthly index review, the Trade Limit for each security (i.e., the maximum security weight change) is calculated as 10% of its Average Daily Traded Value, assuming a portfolio value of 1 billion USD:

\[
\text{Trade Limit} = \left(10\% \times \text{Average Daily Traded Value}\right) / 1\ \text{billion}
\]

The Average Daily Traded Value of a security is calculated as the average of the daily traded values in the one month prior to the Rebalancing Date. The daily traded value of a security is equal to the number of shares traded during the day, multiplied by the closing price of that security.
Appendix V: Handling Infeasible Optimizations

During the monthly index review, in the event that there is no optimal solution that satisfies all the optimization constraints defined in Section 3.3, the constraints will be relaxed sequentially as follows, until an optimal solution is found:

1) Relax the turnover constraint and factor exposure constraints on style, industry and country factors. This is achieved automatically using the Soft Constraint feature of the Barra Optimizer, by setting both turnover constraint and factor exposure constraints as Soft Constraint.
2) Relax the trade limit constraint by allowing two times the original Trade Limit for each security.
3) Relax the constraint on index constituent weight by constraining the weight of an index constituent to be no more than +/- 3.75% , instead of no more than +/- 3.0%
4) Relax the maximum number of index constituents to 1.25 times the original maximum number of stocks.

The above constraint relaxation sequence is followed mechanically. In the event that no optimal solution is found after all the above constraints have been relaxed, the relevant Market Neutral Barra Factor Index will not be rebalanced for that month.
Appendix VI: New release of Barra Equity Model or Barra Optimizer

Any major new release of the relevant Barra Equity Model or Barra Optimizer will replace the former version within a suitable timeframe.

If there are structural changes in the new release of the relevant Barra Equity Model (for example, the new model has different factors or a particular factor has different underlying descriptors), the relevant MSCI Market Neutral Barra Factor Index will be linked to the factor that is most closely linked to the existing Target Factor, based on the underlying descriptors and the historical risk and return profile of the factors. The relevant MSCI Market Neutral Barra Factor Index will be renamed if appropriate to reflect the name of the new underlying Barra Equity Model factor.
Appendix VII: Barra Model Data Delays or Corrections

If there is a delay in the monthly release of security exposure data and factor variance and co-variance data of the relevant Barra Equity Model, all MSCI Market Neutral Barra Factor Index clients will be notified, and the monthly index review of the relevant MSCI Market Neutral Barra Factor Indices will be delayed until the relevant Barra model data is available. In the event that the relevant Barra model data is delayed for more than 5 business days after the target release date, the index review of the relevant MSCI Market Neutral Barra Factor Indices will not be conducted for that month.

If there is a correction of the relevant Barra model data within 5 business days following the Rebalancing Date, and the impact of the correction is determined to be significant, a new index review will be conducted for the relevant MSCI Market Neutral Barra Factor Indices. The impact of the correction will be considered significant when either the impact on the Target Factor exposure of the relevant MSCI Market Neutral Barra Factor Indices is above a threshold of 0.1, or the impact on the Active Risk of the relevant MSCI Market Neutral Barra Factor Indices is above a threshold of 0.5% in absolute terms.

All MSCI Market Neutral Barra Factor Index clients will be notified at the time of a relevant Barra model data correction. The new index review will be conducted on the close of the second business day and announced on the close of the third business day following the Barra data correction. The changes resulting from the new index review will be implemented as of the close of the fourth business day following the Barra data correction (effective on the fifth business day following the Barra data correction). The index levels of the relevant MSCI Market Neutral Barra Factor Indices prior to the new index review will not be restated.
Appendix VIII: Corporate Event Treatment

The corporate event treatment is applied on each sub-index of MSCI Market Neutral Barra Factor Index separately. The following table describes the treatment of the most common corporate events in the Long Index of an MSCI Market Neutral Barra Factor Index. Similar treatment will be applicable to Short Index constituents based on corporate events. Details regarding the treatment of all other corporate events not covered in this appendix can be found in the MSCI Corporate Events Methodology book, available at [http://www.msci.com/products/indices/size/standard/methodology.html](http://www.msci.com/products/indices/size/standard/methodology.html)

About MSCI

MSCI Inc. is a leading provider of investment decision support tools to investors globally, including asset managers, banks, hedge funds and pension funds. MSCI products and services include indices, portfolio risk and performance analytics, and governance tools.

The company’s flagship product offerings are: the MSCI indices with close to USD 7 trillion estimated to be benchmarked to them on a worldwide basis; Barra multi-asset class factor models, portfolio risk and performance analytics; RiskMetrics multi-asset class market and credit risk analytics; IPD real estate information, indices and analytics; MSCI ESG (environmental, social and governance) Research screening, analysis and ratings; ISS governance research and outsourced proxy voting and reporting services; and FEA valuation models and risk management software for the energy and commodities markets. MSCI is headquartered in New York, with research and commercial offices around the world.

1 As of September 30, 2012, as published by eVestment, Lipper and Bloomberg on January 31, 2013
